Title: Title of the research work 22 font's time new roman

Create a specific, concise title (10–15 words) in Times New Roman, 22pt, centered, checked for clarity with a peer. Avoid vague or lengthy titles to accurately reflect the project's scope.

Chapter 1
Introduction

1.1 Overview

Provide a background, explain the project's real-world significance, and state specific goals in Times New Roman, 12pt, using simple language for clarity.

1.2 Literature Review

Summarize credible sources, organized by themes, in a review using Times New Roman, 12pt, to highlight past work and gaps addressed by the project. Any one of the following two formats is acceptable for the report. Use at least 15 recent papers (Year 2020 to 2025) as the references.

Format 1:

Paper	Algorithm/ methodology	Results	Limitations
[8]	MLs are applied on four plants: apple, cassava, cotton, and potato to detect disease in [8].	The paper compared strategies of disease management and support against Faster R-CNN, SVM, Bi-directional RNN and ResNet152 V2 in tabular form.	The main limitation of the paper is that it reveals only previous results and very few numerical results are found even no new proposed algorithm is found.
[9]	Application of three CNN models: ResNet50, VGG16 and AlexNet is found in [9] to detect learners' personalities.	Four face action unit (EU) from eyebrows, eyes, nose and mouth are taken as the feature then accuracy, loss and ROC score are compared for above three CNNs.	The limitation of the paper is that it only concentrated on CNN not on other deep learning
[11]	In [11], 'Deep Learning and transfer learning techniques' are applied in	The precision, recall, F1_score and accuracy are compared for six models: VGG16, Xception,	The limitation of the paper is that, it did not

Paper	Algorithm/ methodology	Results	Limitations
	identification and classification rice leaf diseases taking 5932 leaf images of benchmark datasets.	ResNet50, DenseNet121, InceptionResnetV2, and Inception V3.	make any preprocess on the images.

Format 2:

This section deals with some previous works relevant to the idea of this project work and their format is shown below.

The ECG signal of telecardiology contains large amount of data to be recorded hence its compression is necessary. The following mathematical tools of frequency analysis: FFT, DST, DCT, SAPA/FAN and DCT-II are applied for lossless compression of ECG and DCT and SAPA/FAN is found better than other techniques in lossless compression, explained in [1]. In [2], the performance of 32 and 64-point FFT is computed applying multiple RADIX Algorithms. The authors applied the concept of pipeline in FFT, to increase the throughput of system. Simulation of three algorithms: Radix-2, Radix-4 and Radix-8 is used for comparison.

Combination of DWT and DCT has been used for embedding and extraction copyright protection by using digital watermarking method. This two method DWT+DCT applied on two-dimensional images. This technique works in frequency domain and it is more robust then provides good performance as proposed in [3-5]. Shivang Ghetia et al. has executed 2-D discrete cosine transform algorithm on GPU. They have used and implemented 2-D DCT with parallel approach on NVIDIA GPU using CUDA (Compute Unified Device Architecture) as discussed in [6].

1.3 Contribution of Project Work

List 3–5 specific, quantified contributions of the project using Times New Roman, 12pt, explaining how they address literature gaps. Use bullet points, avoid vague claims, and link to the Literature Review with a brainstorming table.

1.4 Organization of Project Work

Provide a concise paragraph outlining the report's chapter structure in Times New Roman, 12pt, using simple language. Focus on describing each chapter's content briefly, avoiding project details or results, and ensure accuracy by reviewing the table of contents.

Chapter 2
Basic Theory

Summarize relevant theories or concepts (10-12 pages) in Times New Roman, 12pt, using simple language, defining terms, and linking to project goals for a beginner audience.

Chapter 3
Methodology

Describe the project's step-by-step workflow, algorithm design with pseudocode, and data analysis methods, using Times New Roman, 12pt, including a labeled flowchart, clear pseudocode, and metrics tied to goals, ensuring clarity for replication and beginners.

Chapter 4
Expected Results and Discussions

Present project findings with labeled visuals (tables/graphs/figures) and analyze their significance, compare with prior work, discuss limitations, and suggest improvements, provide explanation of each graph/figure with their numbers using Times New Roman, 12pt,.

Chapter 5
Conclusion

Restate project goals, summarize findings and contributions from Section 1.3, note limitations, and suggest 1–2 realistic future work ideas using Times New Roman, 12pt, with clear, simple sentences, avoiding new results or vague summaries.

References

List all the cited sources in IEEE/APA/Harvard style, grouped by type, in Times New Roman, 10pt, with complete details.
